INTRODUCTION

The fourth triennial bottom trawl survey of the Aleutian Islands region was completed during the summer of 1991 by the Resource Assessment Conservation Engineering (RACE) Division of the Alaska Fisheries Science Center (AFSC), Seattle, WA. The triennial groundfish surveys are designed to describe and monitor the distribution, abundance, and biological condition of the important groundfish stocks in the Aleutian Islands area. Previous surveys in this series were conducted in 1980, 1983 and 1986. The purpose of this report is to provide pertinent information collected by the research vessels to the U.S. fishing industry.

METHODS

The survey was conducted in three 23-day legs aboard two chartered commercial trawlers, the *Ocean Hope 1* and the *Green Hope*, from July 17 to September 27, 1991. The survey area covered a portion of the southern Bering Sea, from 165°W long. to 170°W long. and throughout the Aleutian Islands from 170°W long. to Stalemate Bank, 170°30'E long. (Figure 1). Sampling proceeded from east to west at pre-selected stations at depths ranging from 9 to 285 fathoms (16-521 meters (m)).

Description of Survey Area

Historically, the Aleutian Islands have been important fishing grounds for a variety of groundfish species including Pacific ocean perch (Sebastes alutus), Atka mackerel (Pleurogrammus monopterygius), walleye pollock (Theragra chalcogramma), Pacific cod (Gadus macrocephalus), Pacific halibut (Hippoglossus stenolepis), sablefish (Anaplopoma fimbria), rockfishes (Sebastes spp.) and several invertebrate groups including crabs and squid.

The Aleutian archipelago consists of 47 major islands extending westward in a nearly 1,500 kilometer (km) arc from the Alaska Peninsula to Attu Island. Located among the westernmost islands are several prominent banks and reefs including Petrel Bank located north of the island chain at approximately 180°W long., Buldir Reef and adjacent Tahoma reef (176°E long.), and Stalemate Bank, west of Attu Island (171°E long.). The bathymetry of the sea floor in the Aleutian region reflects the volcanic origin of the islands and is characterized by an irregular bottom, narrow continental shelf, and abrupt continental slope. The Aleutian Trench, approximately 120 km south of the chain, with depths from 4 to 7 thousand m defines the southern limit of the continental shelf and slope. The northern continental shelf and slope varies

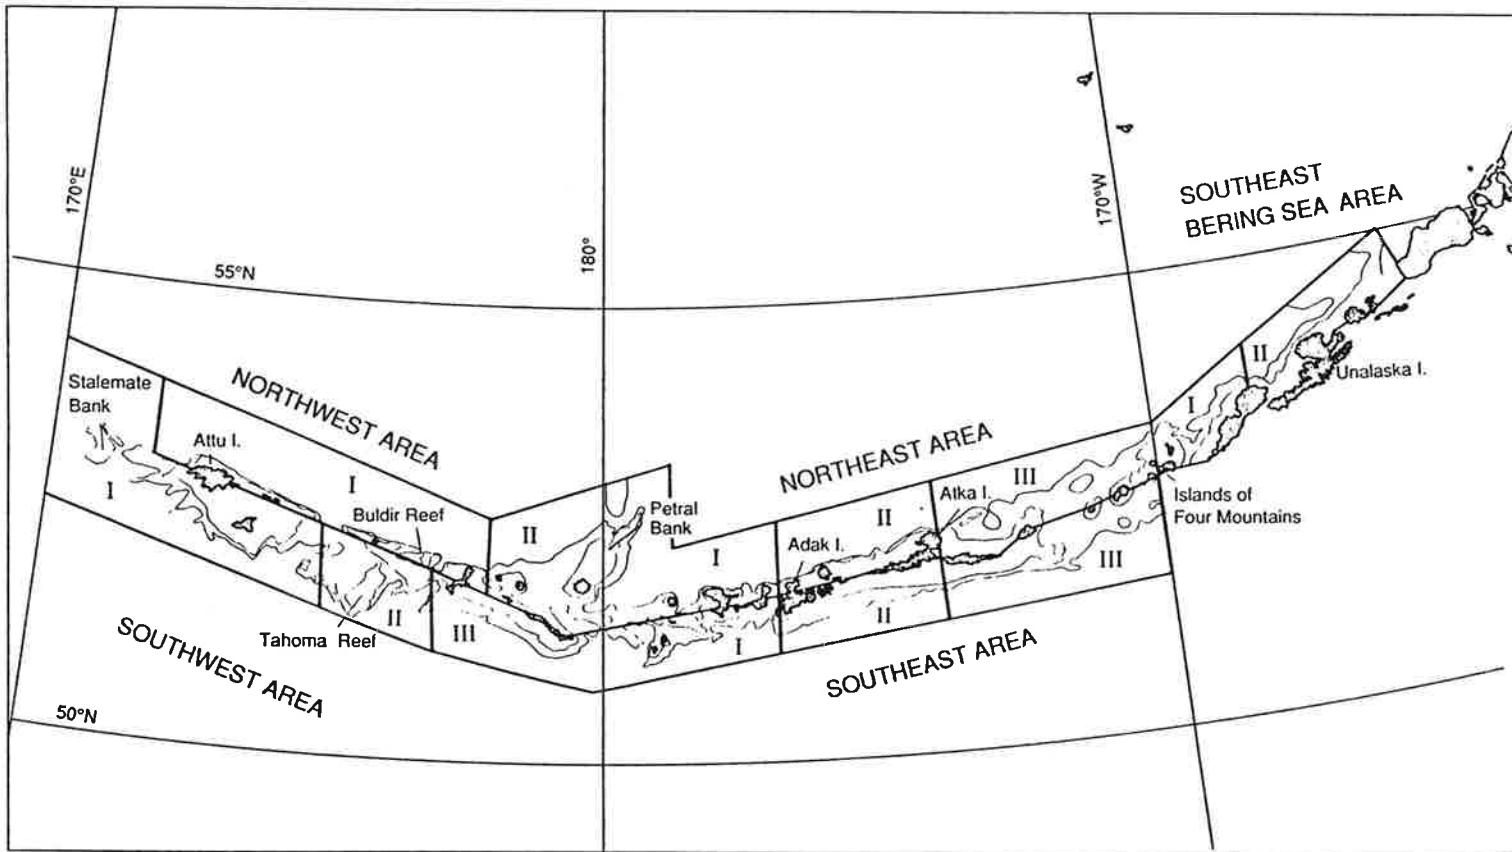

Figure 1.-- Areas surveyed during the 1991 Aleutian Islands triennial groundfish survey.

from 30 to 75 km in width and is bounded by Bowers Basin in the west and the Aleutian Basin in the east.

Vessels and Gear Characteristics

The *Ocean Hope 1* is 108 ft. (32.9 m) in overall length and powered by a single main engine with 850 continuous horsepower. Deck equipment included paired hydraulic winches with 600 fm (1,100 meters) of 7/8" (2.2 cm) cable per drum, two hydraulic net reels (one mounted over the stern ramp and the other mounted forward on the working deck), and two winches (one moveable) mounted on the main boom for lifting. The *Green Hope* is 100 ft. (30.7 m) in overall length and powered by a single main engine of 565 continuous horsepower. Deck equipment included paired hydraulic trawl winches with 800 fm (1,463 m) of 3/4" (1.91 cm) cable per drum, two hydraulic net reels (one mounted over the stern ramp and the other mounted forward on the working deck), and two stationary winches mounted on the main boom for lifting. Electronic equipment on both vessels consisted of Global Positioning System (GPS) and Loran C receivers with converters for geodetic positions, Loran C video plotters, two radars, single band and VHF radios, color video fish finders, and auto-pilots.

Both vessels used standard RACE Division polyethylene, high opening, Noreastern bottom trawls rigged with roller gear. Gear specifications included: an 89'-1" (27.2 m) headrope with twenty-one 12" (30 cm) diameter floats, and a 79'-7" (24.3 m) 1/2" longlink alloy chain "fishing line" attached to an 81'-7" (24.9 m), 3/8" (.95 cm) diameter 6 X 19 galvanized wire footrope. The roller gear was 79'-6" (24.2 m) long and constructed of 3/4" (1.91 cm) diameter 6 X 19 galvanized wire rope, 14" (36 cm) rubber bobbins separated by a solid string of 4" (10 cm) rubber disks. In addition, 19'-6" (5.9 m) wire rope extensions with 4" (10 cm) and 8" (20 cm) rubber disks were used to span each lower flying wing section.

Trawls were constructed of 5" (12.7 cm) stretched-mesh polyethylene web with a 1-1/4" (3.2 cm) mesh nylon liner in the codend. Net rigging consisted of triple 180' (54.9 m), 5/8" (1.6 cm) diameter galvanized wire rope dandylines. The dandylines were rigged with 18" and 9" chain extensions to the headrope and side panel attachments respectively. Steel V-doors with dimensions of 6'x 9' (1.83 x 2.74 m), and weighing approximately 1,700 lbs. (800 kg) each were used. Preliminary examination of the net mensuration data revealed that the nets towed by the *Ocean Hope 1* had a mean path width of 50.5' (15.4 m) as measured between the wing tips, while those towed by the *Green Hope* had a mean path width of 50.2' (15.3 m).

Survey Design and Operations

The stratified random survey design used for the 1983 and 1986 triennial surveys was again employed during 1991 to make efficient use of limited vessel time and provide consistency with earlier surveys. The survey region was first divided into major areas and then again into subareas based on the biomass distributions of the major species encountered during the 1980 and 1983 surveys (Figure 1). The subareas were further divided into three 100 m depth strata from 1 to 300 m and a single 200 m depth stratum between 300 and 500 m.

A total of 452 pre-selected stations were randomly selected from a pool of previously successful stations. The proportion of the total available sampling effort allocated to each stratum was the same as the 1986 survey which generally allocated the highest sampling densities to strata with the highest fish densities. Within each stratum stations were arbitrarily divided between the two survey vessels to minimize temporal and spatial separation of sampling effort.

Standard trawl hauls were 30 minutes in duration, allowing between 3 and 12 minutes sinking time between setting the winch brakes and beginning the tow. Efforts were made to maintain each tow at a constant depth. In cases where depths increased during a tow, trawl warps increased accordingly. Catches were sorted to species, weighed and enumerated according to standard AFSC and RACE Division protocol. A variety of biological data (age, length, sex, weight, and maturity of individual specimens) were taken. Special requests were also fulfilled for stomach, tissue, and whole fish samples.

RESULTS

Because of time lost to bad weather and gear repair, some stations were not sampled. Successful trawls were achieved at 350 of the 379 stations attempted. A total of 108 fish species were identified in survey catches. In addition to the groundfish species, catches also contained representatives from numerous invertebrate orders. Table 1 shows the dominant fish species ranked by catch per unit of effort, expressed as kilograms of catch per square kilometer trawled, (kg/km^2) for the five sampling areas (Figure 1). West of 170°W long., Atka mackerel, Pacific ocean perch, northern rockfish (Sebastes polyspinis), walleye pollock, and Pacific cod dominated the catches in most areas. The largest fish concentrations encountered during the survey were in the western Aleutian Islands (west of 180°W long.) and were composed primarily of Atka mackerel, Pacific ocean perch and northern rockfish. Catches in the eastern Aleutian Islands were represented mainly by Atka mackerel, Pacific ocean perch and walleye pollock. Pacific cod were relatively evenly distributed throughout the

survey area. Important components of catches from the Southern Bering Sea area were walleye pollock, arrowtooth flounder (Atheresthes stomias), Pacific cod, and rock sole (Pleuronectes bilineatus).

ORGANIZATION OF REPORT

This report focuses on the catch data collected at individual stations and includes information for the principal species encountered during the survey. The fishing results are presented in Section 1 for the *Ocean Hope* 1 and Section 2 for the *Green Hope*. Each section has three parts: 1) station charts with haul numbers plotted adjacent to their respective geographical locations, 2) summary listings of species catches by haul, and 3) summary listings of catch rates in descending order of magnitude for selected species of commercial interest.

Explanations of the labels appearing in the fishing logs are summarized in Table 2.

The Appendix contains specifications and diagrams of the fishing gear used during the survey (Table A1).

For further information contact Dr. Gary Stauffer, Director, Resource Assessment and Conservation Engineering Division, Alaska Fisheries Science Center, National Marine Fisheries Service, 7600 Sand Point Way NE., Building 4, BIN C15700, Seattle, WA 98115-0070 -- Telephone (206) 526-4170.

Table 2.-- Definitions of labels used in the fishing logs of the 1991 triennial bottom trawl survey.

| | |
|-------------------|--|
| Gear depth- | fathoms |
| Duration of tow- | tenths of an hour (standard tow is one-half hour) |
| Distance fished- | nautical miles |
| Gear performance- | 0 = satisfactory 1 = satisfactory tow, net snagged bottom but damage and fish loss were minimal 5 = unsatisfactory tow 6 = unsatisfactory, net snagged bottom 7 = unsatisfactory tow, torn net |
| Gear type- | 172 = polyethylene Noreastern bottom trawl with roller gear |
| Catch units- | The listings of total species catches by haul are in kilograms. The summary listings of catch rates for selected species use kilograms of catch per nautical mile trawled. A 0.0 kg weight indicates a catch of less than 0.1 kg/nm. |

Fishing Log for the *Green Hope*

- Station charts of haul numbers plotted adjacent to their respective geographical locations

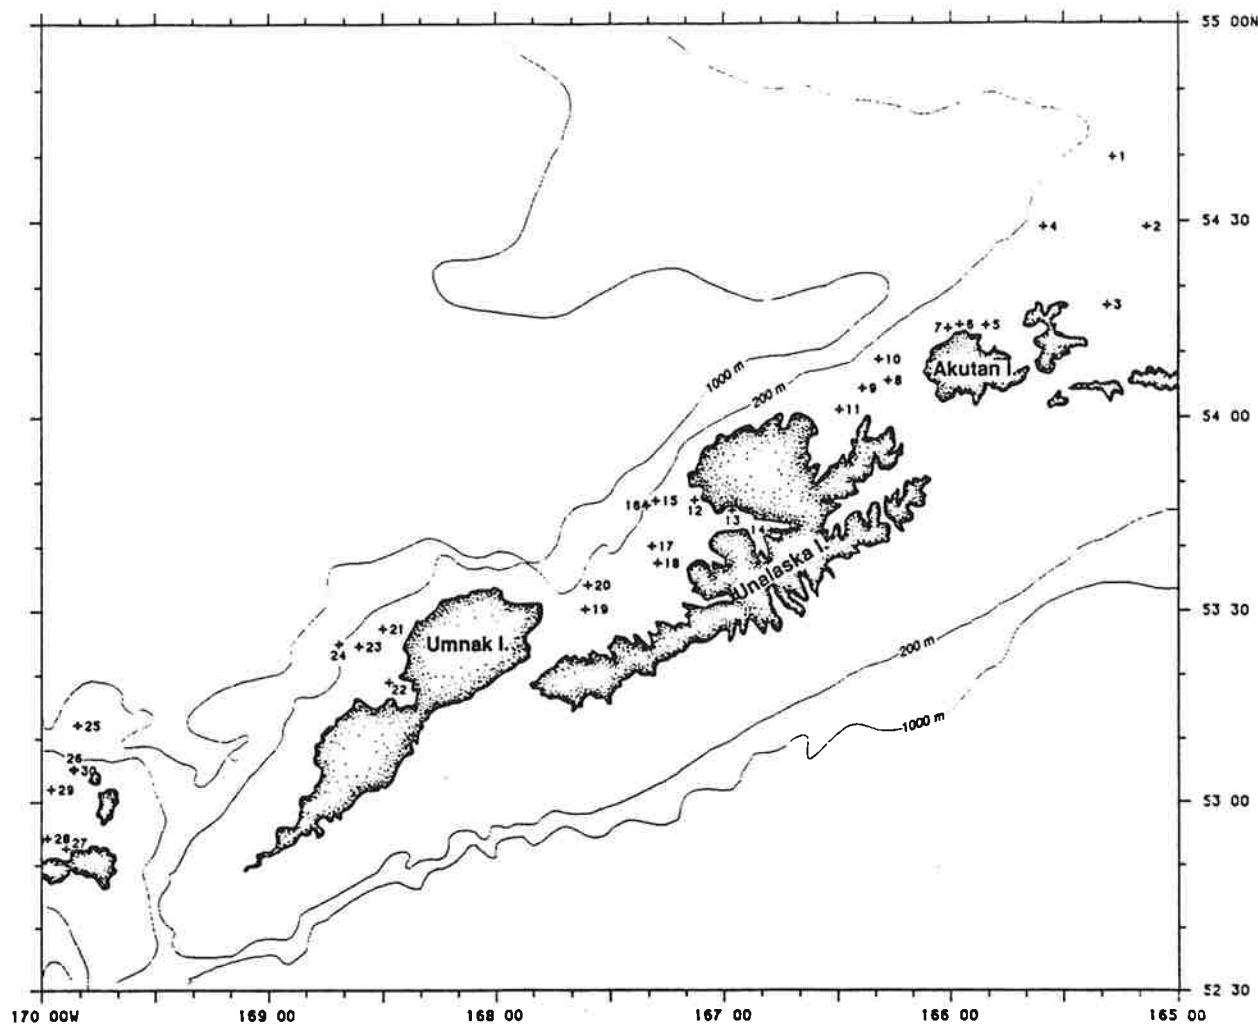

Figure 6.--Stations surveyed by the F/V *Green Hope* from Akutan Island to the Islands of Four Mountains (hauls 1-30).

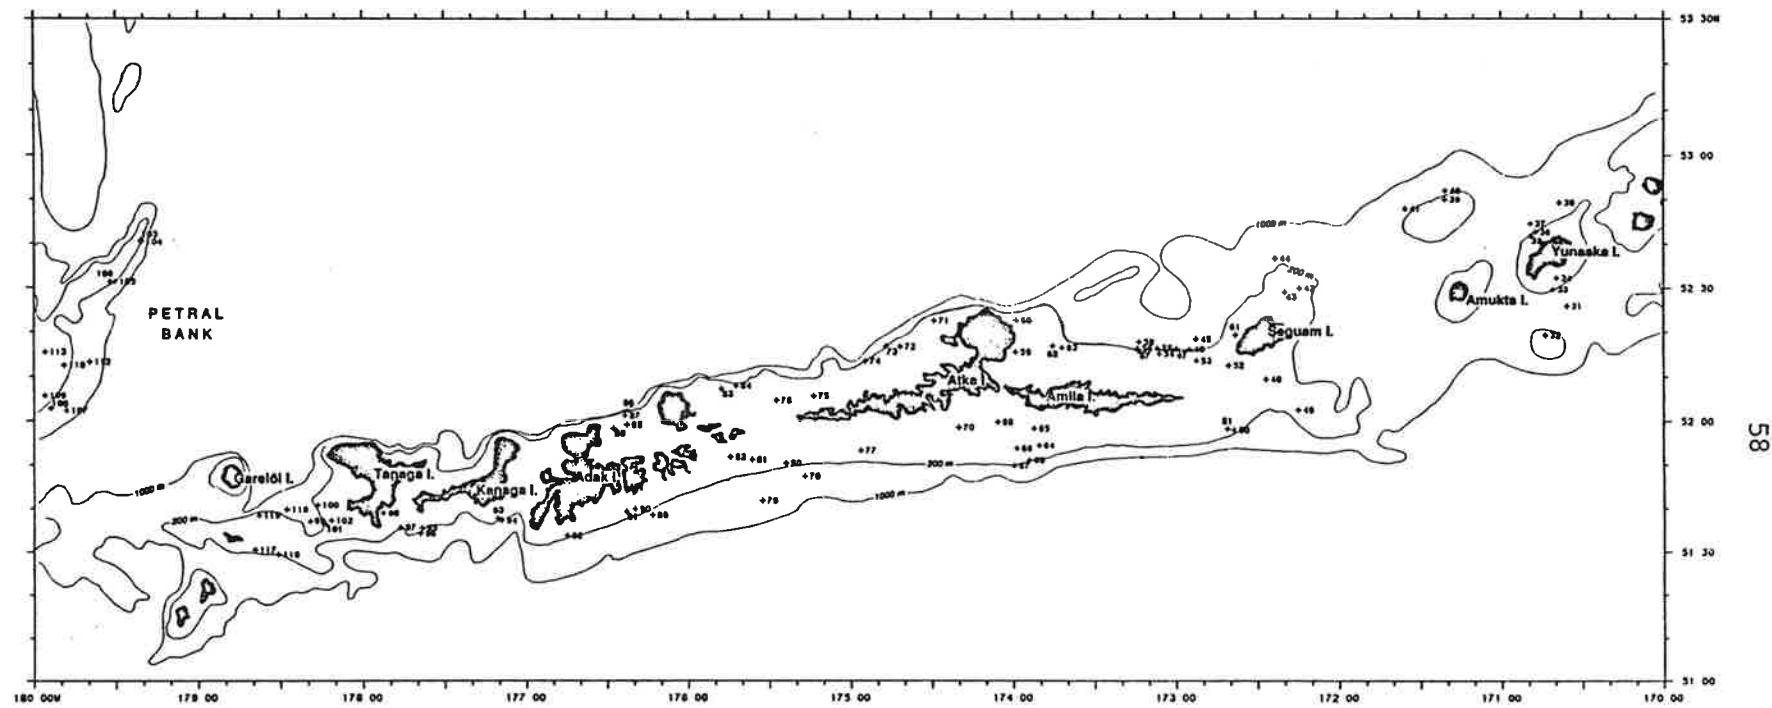

Figure 7.--Stations surveyed by the F/V Green Hope from Yunaska Island to Gareloi Island (hauls 31-102, 116-120) and eastern Petral Bank (103-110, 112-113).

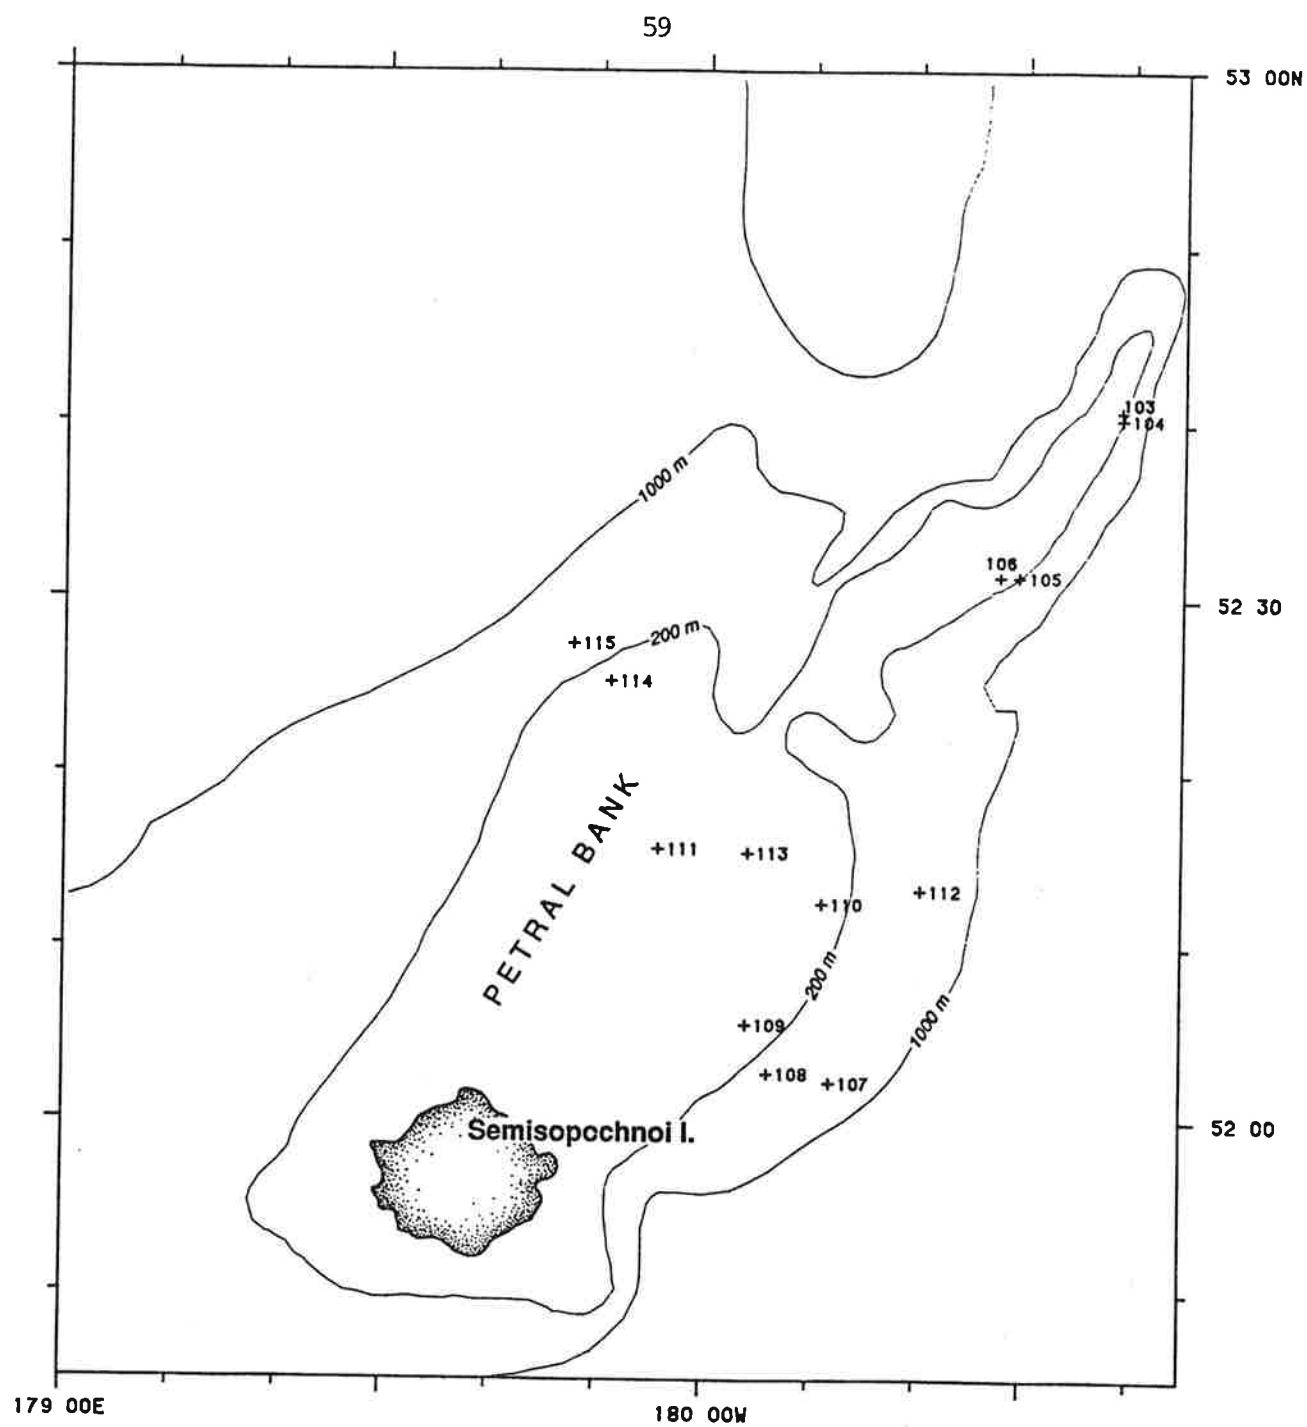

Figure 8.--Stations surveyed by the F/V Green Hope in the Petral Bank area (hauls 103-115).

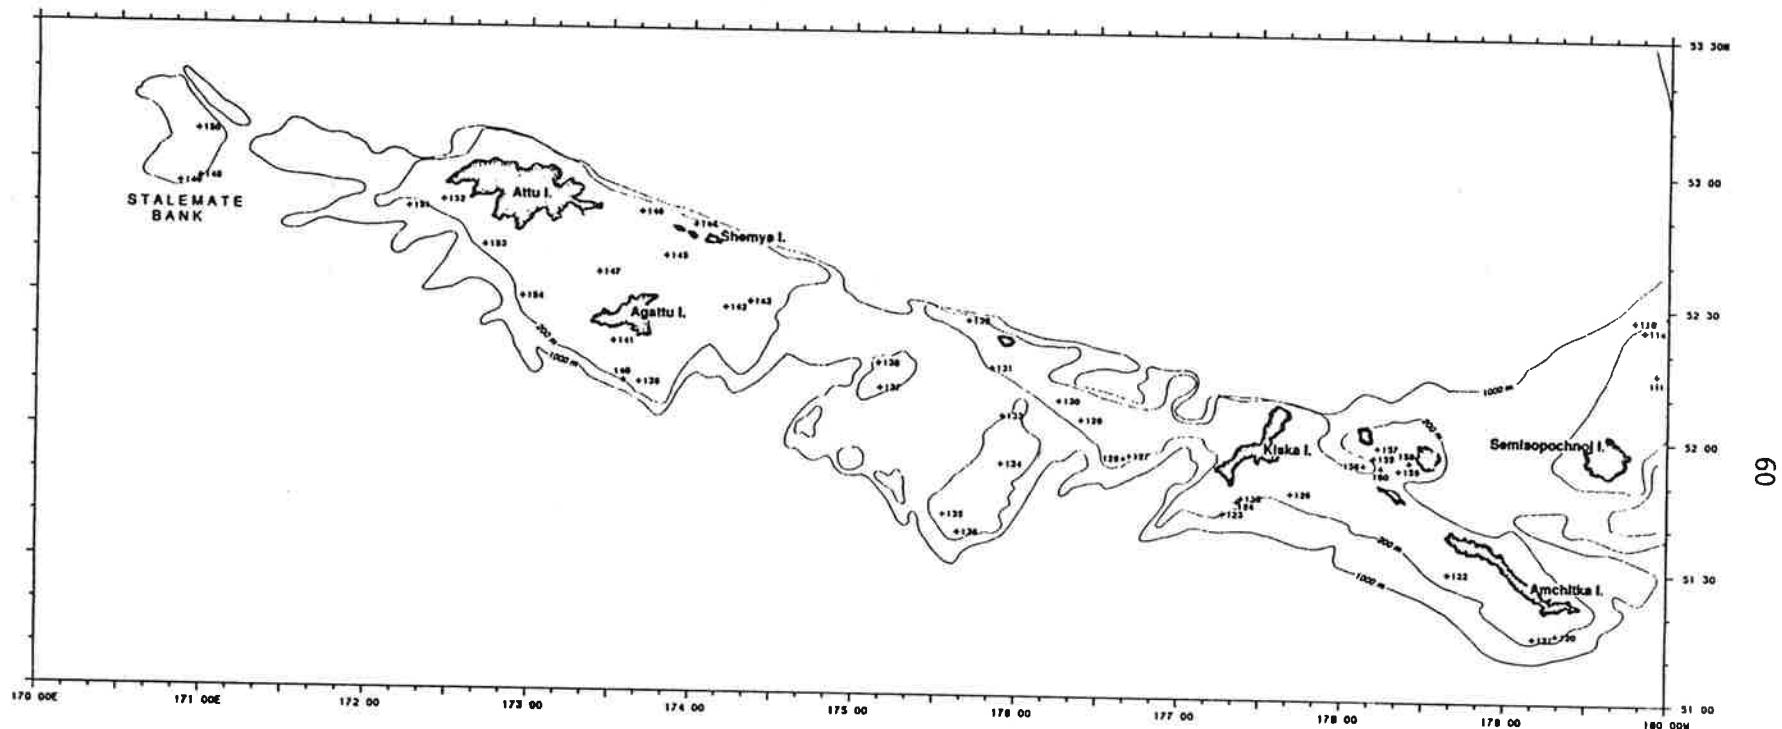

Figure 9.--Stations surveyed by the F/V Green Hope from Amchitka Island to Stalemate Bank (hauls 120-160) and western Petral Bank (hauls 111, 114-115).

Section 2 (continued)

Fishing log for the *Green Hope*

- Summary listings of species catches by haul
 - Haul start latitude and longitude
 - Loran readings
 - Bottom depth in fathoms
 - Duration of tow in hundredths of an hour
 - Distance fished in nautical miles
 - Total catch weight in kilograms by species
