INTRODUCTION

Between 20 July and 31 August 1993, scientists from the Auke Bay Laboratory (ABL) of the Alaska Fisheries Science Center (AFSC) used the NOAA RV *Miller Freeman* to conduct a bottom trawl survey of groundfish in the eastern Gulf of Alaska. The vessel completed 167 trawl hauls along the continental shelf and upper continental slope of this region from Dixon Entrance near the Alaska/British Columbia boundary to Cape St. Elias in the northern Gulf of Alaska (Fig. 1). The 1993 survey was the fourth triennial trawl survey of the eastern Gulf of Alaska; previous surveys were completed here in 1984, 1987, and 1990.

In 1993, a similar bottom trawl survey was conducted in the Gulf of Alaska west of Cape St. Elias by the AFSC Resource Assessment and Conservation Engineering Division (RACE). Three chartered commercial fishing vessels were used for this survey: the FV *Argosy*, FV *Alsea*, and FV *Progress*. An industry report for this survey has been prepared by Payne and Martin (1994), which can be obtained by contacting: Dr. Gary Stauffer, Director, RACE Division, Alaska Fisheries Science Center, 7600 Sand Point Way N. E., Bin C15700, Seattle WA 98115, Telephone (206) 526-4170.

SURVEY OBJECTIVES

1. Determine the distribution, abundance, and size composition of major groundfish species in outside waters of the eastern Gulf of Alaska.
2. Collect ancillary biological samples of selected species, such as otoliths for age determination, and electrophoretic and DNA genetic samples for stock identification.

METHODS

Fishing Vessel and Gear

The RV *Miller Freeman* is a 65.5 m (215 ft) stern trawler equipped with modern trawling and navigational systems. The vessel's main engine is rated at 2,150 horsepower.

A high opening, polyethylene Nor'easter trawl was used for all fishing operations. This net was originally tested during the 1984 triennial survey in the Gulf of Alaska, and was selected as the most appropriate standard for a multi-species bottom trawl survey in this region. The net was constructed of polyethylene webbing with four seams, and measured 27.2 m (89.1 ft) along the headrope and 24.9 m (81.6 ft) along the footrope. The net's mesh measured 12.7 cm (5 in) stretched, with a nylon codend liner whose mesh measured 3.2 cm (1.25 in) stretched. Triple dandylines on each side, 54.9 m (180 ft) long, connected the net to a pair of steel "V" doors measuring 1.8 m by 2.7 m (6 ft by 9 ft) and weighing 998 kg (2200 lb) each. Roller gear was

attached to the footrope of the net to facilitate towing over rough bottoms, and consisted of 36 cm (14 in) diameter rubber bobbins separated by 10 cm (4 in) diameter rubber disks. See Appendix A for detailed specifications of the net and its accessories.

Survey Design

The survey design was similar to that used in previous triennial surveys of the eastern Gulf of Alaska in 1987 and 1990. For a detailed discussion of this design, see Stark and Clausen (1995). A brief description of the design follows:

The survey area was limited to offshore waters of the continental shelf and upper continental slope in depths <500 m; inshore passages and bays were not sampled. This area was divided into 15 subareas based on topography (shelf, gully, or slope) and depth for the purpose of station allocations and analysis of results (Table 1). The allocation scheme was nearly identical to that used in the 1990 survey, although the number of stations in each subarea was reduced by approximately 10% because fewer vessel days were available for the survey in 1993. This resulted in 180 planned stations for 1993. In general, density of planned stations increased with depth to obtain a better statistical sample of rockfish (*Sebastodes* spp. and *Sebastolobus* spp.) and sablefish (*Anoplopoma fimbria*), which are the most valuable commercial groundfish species in this region. These species mostly inhabit depths >200 m on the continental slope and in gullies. No stations were allocated to the "Southeastern Shallows" (1-100 m depth) subarea because the 1987 survey had found virtually this entire stratum to be untrawlable using the survey's standard nets.

Station Locations

Planned station locations were randomly determined using the same procedure as in the 1987 and 1990 triennial surveys. For shelf and gully subareas, the survey area was divided into a grid of squares measuring 5 nautical miles (n mi) on each side (25 n mi²). The stations to be sampled in each of these subareas were then selected from this grid using a random number table. If records from the 1990 survey indicated that a selected grid square was completely untrawlable, another square was randomly selected. The actual geographic coordinates of a station were at the center of the square.

A slightly different approach was necessary to select station locations in slope subareas. The grid technique was not used because these subareas are relatively small and are extremely narrow and long. Instead, for each slope subarea, transect lines were drawn such that the area between transect lines was 25 n mi². Thus, the slope subareas were composed of a number of irregularly shaped segments analogous to the grid squares on the shelf and gullies. The slope stations were then selected randomly from these segments. The specific coordinates of a slope station were approximately halfway between the two transect lines bounding each segment.

For each of the 180 randomly located stations, an alternative, non-random station in the same subarea was also determined. These alternative stations were necessary as "backup" stations in case the original planned station proved to be untrawlable. The alternative stations were selected from successful trawl hauls made during 11 previous survey cruises in the eastern Gulf of Alaska from 1978 to 1990.

Fishing Operations and Catch Sampling

Fishing and catch sampling methods were generally similar to those used in previous AFSC trawl surveys. Prior to fishing, each station was surveyed using the RV *Miller Freeman's* recording fathometer, and a trawl path was selected. This surveying was usually done at night previous to the day when the station was to be fished. The vessel's officers were given the discretion to locate the trawl path anywhere within the station's boundaries (i.e., within the boundaries of the station's grid square). If the fathometer survey indicated the station was untrawlable, the alternative station was substituted, and this alternative station was also surveyed.

Standard duration of hauls was 30 minutes, measured from the time the net reached bottom until the start of haul back. A Furuno¹ net-sounding system was used to monitor the position of the net relative to the bottom. This system allowed a precise determination of when the net touched bottom and also ensured that it remained on bottom for the rest of the tow. At some stations, because of rough bottom, net hang-ups, or expected large catches of fish, hauls were shorter than 30 minutes. Tows less than 10 minutes long, or where the net was severely ripped, were not considered valid, and results from these tows were not included in the survey's analysis. Towing speed of the RV *Miller Freeman* averaged 3.1 knots, and for individual hauls ranged from 2.5 to 4.1 knots.

An acoustic net mensuration system (the "SCANMAR") was used on hauls #1 - #59 to measure the width of the net opening. Width measurements were especially critical to determine the area swept by the trawl, data which are essential for subsequent calculations of catch per unit effort and biomass. The average net width for individual hauls ranged from 12.75 to 18.12 m. The SCANMAR system became inoperable after haul #59; consequently, net width for the remainder of the hauls was estimated based on the data collected when the system was working. Original plans were also to measure the average height of the net, but the height-sensing unit did not function properly at the start of the cruise, and was not subsequently deployed.

Catches less than approximately 2,500 lb were processed in their entirety. The catch was sorted, weighed, and counted by species. For abundant or commercially important species, sex was determined and the fish were measured for length frequency distributions. When a species was very abundant in a catch, a random subsample of about 100-200 individuals was taken for the sex determinations and length measurements. Pacific halibut (*Hippoglossus stenolepis*) and sablefish were generally measured without being sexed and returned immediately to the sea. For

¹Reference to trade names does not imply endorsement of the National Marine Fisheries Service, NOAA.

catches >2,500 lb, a load cell was used to weigh the entire catch, and a 1,000-2,000 lb subsample was retained and processed in the above manner; the unprocessed remainder of the catch was discarded overboard.

In many hauls, otoliths (earbones) from selected species were collected and retained for age determination. These species included arrowtooth flounder (*Atheresthes stomias*), juvenile sablefish, walleye pollock (*Theragra chalcogramma*), shortspine thornyhead (*Sebastolobus alascanus*), Pacific ocean perch (*Sebastodes alutus*), and rougheye (*S. aleutianus*), silvergray (*S. brevispinus*), dusky (*S. ciliatus*), redstripe (*S. proriger*), sharpchin (*S. zacentrus*), and shortraker (*S. borealis*) rockfish. Two otoliths were collected from each individual fish. For all species except shortraker rockfish and juvenile sablefish, a stratified random sampling procedure was used: in an individual haul, otoliths were collected from 2 fish per cm length per sex for walleye pollock, Pacific ocean perch, and rougheye, silvergrey, dusky, redstripe, and sharpchin rockfish. For arrowtooth flounder, otoliths were taken from 2 fish per cm length per sex in each of the two former International North Pacific Fisheries Commission statistical areas covered by the survey (the Southeastern and Yakutat areas); for shortspine thornyhead, otoliths were collected from 5 fish per cm length per sex over the entire survey area, with no more than 1 fish per cm length per sex sampled in an individual haul. All shortraker rockfish caught were sampled for otoliths, and otoliths were collected randomly from juvenile sablefish in various hauls.

Genetic tissue samples were collected from shortraker and rougheye rockfish and Dover sole (*Microstomus pacificus*) for stock identification studies of these species. For the two rockfish species, heart, liver, muscle, and eye tissue samples were taken from selected specimens and returned to the laboratory for electrophoretic analysis; an additional sample of heart tissue was also collected from each fish for DNA genetic studies. For Dover sole, only heart, liver, and muscle tissue were collected for electrophoresis at the request of the National Marine Fisheries Service, Southwest Fisheries Science Center. Methods and results for these studies will be presented in future reports.

For each haul, surface and bottom water temperature were recorded. Surface temperatures were determined from a bucket thermometer, and bottom temperatures determined from the Furuno net sounder's electronic temperature sensor.

RESULTS

A total of 167 hauls was made during the cruise (Table 2; Fig. 1). Of these, 153 were considered to be successful, i.e., valid for analysis. This was slightly less than the 166 successful survey hauls in the 1990 eastern Gulf of Alaska trawl survey, but more than the 126 successful hauls in the 1987 survey. (The 1984 eastern Gulf survey used a methodology that is not directly comparable with the other three surveys.)

Of the planned, randomly located survey stations, 168 were visited (Table 1). The 12 remaining stations were skipped, either deliberately because of time or scheduling constraints, or by mistake; for example, 3 stations that were supposed to be in the Yakutat Slope 301-500 m subarea were inadvertently located in Yakutat Deep Gullies instead. Six unplanned stations were added to the end of the cruise when it became apparent the cruise would otherwise finish early.

Trawling conditions in the Southeastern area were more difficult than in Yakutat. Overall, the trawlability data in Table 1 can be summarized as follows:

<u>Area</u>	<u>Number of stations (%)</u>		
	<u>Trawlable</u>	<u>M marginally trawlable</u>	<u>Untrawlable</u>
Yakutat	69.9	19.3	10.8
Southeastern	49.4	23.5	27.1

(The true amount of untrawlability in all areas is probably somewhat underestimated in Table 1 because in the station-selection process [see *Station Locations* section], any stations found to be untrawlable in the 1990 survey were not resampled in 1993.) Clearly, much of the Southeastern area is marginally trawlable at best for the gear used in the survey. The difference in trawlability between the two areas is actually greater than these percentages indicate, because the largely untrawlable Southeastern Shallows subarea was not sampled in the survey. In the Southeastern area, only the Baranof-Chichagof Slope and Prince of Wales Slope and Gullies subareas had a high percentage of trawlable stations. In Yakutat, all the subareas were mostly trawlable, except for Yakutat Flats and Yakutat Slope 301-500 m. All these trawlability results in general were similar to those in the 1987 and 1990 eastern Gulf of Alaska surveys (Clausen 1988; Clausen 1991).

Numbers of fish sampled in the survey for length frequency distributions and for otoliths are summarized by species in Tables 3 and 4, respectively.

Pacific ocean perch and arrowtooth flounder were the two most abundant species in the catch for both the Yakutat and Southeastern areas (Tables 5 and 6). Nearly 31% of the total CPUE of Pacific ocean perch came from one extremely productive haul west of Iphigenia Bay in the Southeastern area. Other species with relatively high CPUE's in both areas included sablefish, Dover sole, shortspine thornyhead, and Pacific halibut. Two rockfish species, silvergray and redstripe, had relatively large catches in the Southeastern area, but few or none were taken in Yakutat. Catches of walleye pollock and Pacific cod, usually abundant in the central and western Gulf of Alaska, were generally sparse.

More detailed analysis of the results, including biomass estimates for principal species and estimated population size distributions, is available in Martin and Clausen (1996). Their report combines the data for the 1993 eastern Gulf of Alaska survey (conducted by ABL) with its western and central Gulf of Alaska counterpart (conducted by RACE).

A detailed fishing log of the 1993 bottom trawl survey of the eastern Gulf of Alaska is presented in Appendix B.

APPENDIX A

Specifications for the fishing gear used during RV *Miller Freeman* Cruise
93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

Table A.1.—Specifications for the Nor'eastern bottom trawl and its accessories used during RV *Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

Netting —	Polyethylene, 5" (12.7 cm) stretched mesh, 4-mm and 5-mm twine. 4-mm twine on top and sides; 5 mm on bottom and intermediate.
Headrope —	89' 1" (27.2 m) plus thimbled eyes, of 1/2" (1.3 cm) 6 x 19 galvanized wire rope wrapped with 3/8" (1 cm) 3-strand polypropylene rope.
Footrope —	81' 7" (24.9 m) plus thimbled eyes, of 3/8" (1 cm) galvanized wire rope (Bolsh Line), wrapped with polypropylene rope.
Fishing line —	81' (24.7 m), of 1/2" (1.3 cm) shot-peened, long-link chain. Safe working load 11,300 lb (5,126 kg).
Breastlines —	3/8" (1 cm) 6 x 19 galvanized wire rope wrapped with 3/8" (1 cm) polypropylene. Top corner 19' 6" (5.9 m); bottom corner 8' 8" (2.6 m); top side panel 19' 6" (5.9 m); bottom side panel 30' 6" (9.3 m). Overall lengths exclude thimbled eye at wing tips.
Riblines —	3/4" (1.9 cm) Sampson 2 and 1 Duralon. Top two 114.17' (34.8 m) and bottom two 104.45' (31.8 m), hung 98% of stretched seam length. Web secured to riblines using benzels every 16" (41 cm).
Restrictors —	Polypropylene rope, 1" (2.5 cm) diameter, 14' (4.3 m) circumference, and secured loosely to codend at each ribline, 4' (1.2 m) apart, 5 pieces.
Side seams —	Panels are joined to each other, gathering 3 meshes (4 knots) from each panel. Panels which are secured to framing lines have a selvaged edge created by gathering 3 meshes.
Codend —	110 meshes long x 100 meshes deep. 3½" (8.9 cm) stretched (including one knot) 4-mm double-bar mesh.
Codend chaffing gear —	5½" (14 cm) 6-mm double-bar mesh with hula skirt secured to chaffer. Full coverage of codend.
Codend liner —	Nylon, no. 18, 1¼" (3.2-cm) stretched mesh, 315 meshes circumference and 200 meshes deep, laced to the inside of codend. When stretched, the liner protrudes 2-3' (61–91 cm) beyond codend.

Table A.1.—(continued)

Splitting gear —	1/2" (1.3 cm) diameter galvanized wire rope, 21' (6.4 m) long. Wire is passed through 4 galvanized steel rings which are secured to each ribline.
Flotation —	90 pieces, 8" (20.3 cm) diameter aluminum XX Deep Sea water floats.
Roller gear —	79' 6" (24.2 m) eye to eye, 3/4" (1.9 cm) diameter 6 x 19 galvanized wire rope, with 14" (36 cm) diameter bobbins.
Rigging —	3 dandylines each side, 5/8" (1.6 cm) diameter galvanized wire rope, 180' (54.9 m) long.
Doors —	6' x 9' (1.8 x 2.7 m) steel V-doors, approximately 2200 lb (998 kg) each.

APPENDIX B

FISHING LOG OF THE 1993 TRIENNIAL BOTTOM TRAWL SURVEY OF THE EASTERN GULF OF ALASKA

This appendix consists of three sections that present detailed results of the survey in the form of a fishing log. In Section I, the location of each haul is plotted on maps of the survey area. In Section II, the geographic coordinates are listed for each haul along with other pertinent data, such as the CPUE broken down by species or other taxonomic group. An explanation of the terms and codes used in this section is given in Table B-1. Lastly, Section III shows the CPUE for major species listed by haul in descending order of magnitude, along with their corresponding average weight.

APPENDIX B

SECTION I

**Maps showing locations of hauls completed during RV *Miller Freeman* Cruise 93-09, 1993
triennial bottom trawl survey of the eastern Gulf of Alaska**

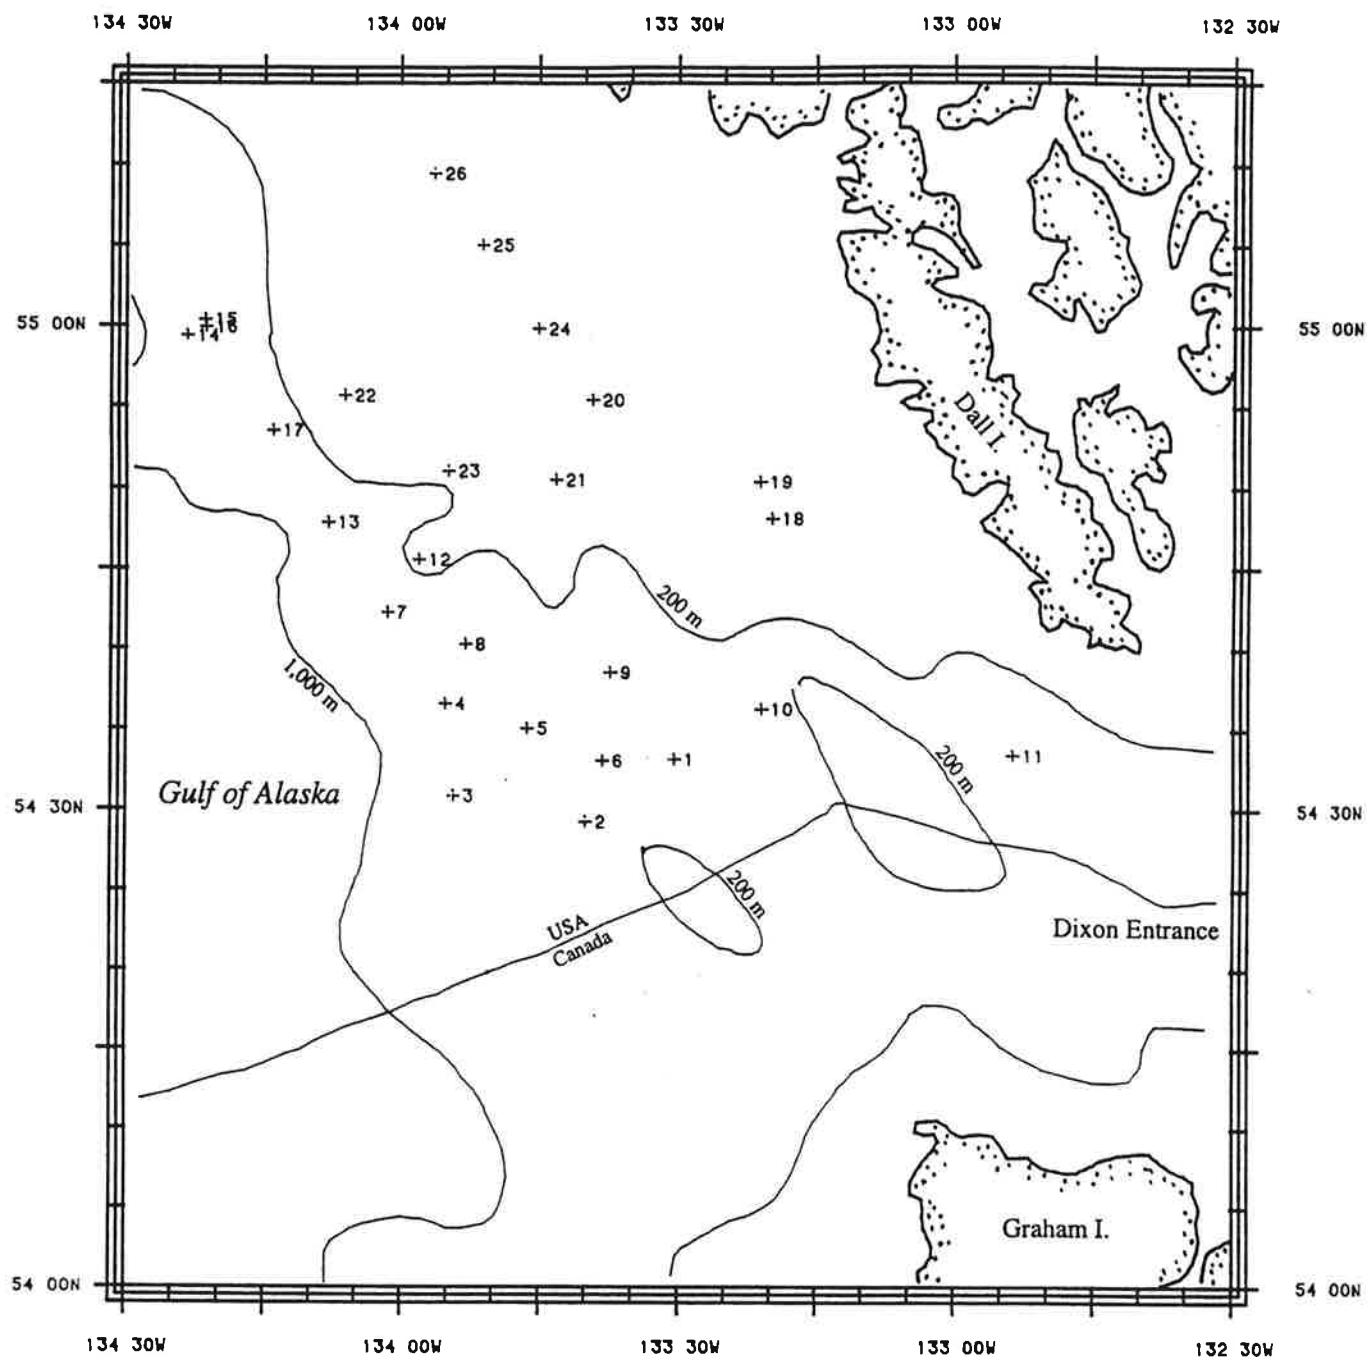

Figure B.1.—Hauls completed in the Dall Island/Dixon Entrance vicinity during *RV Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

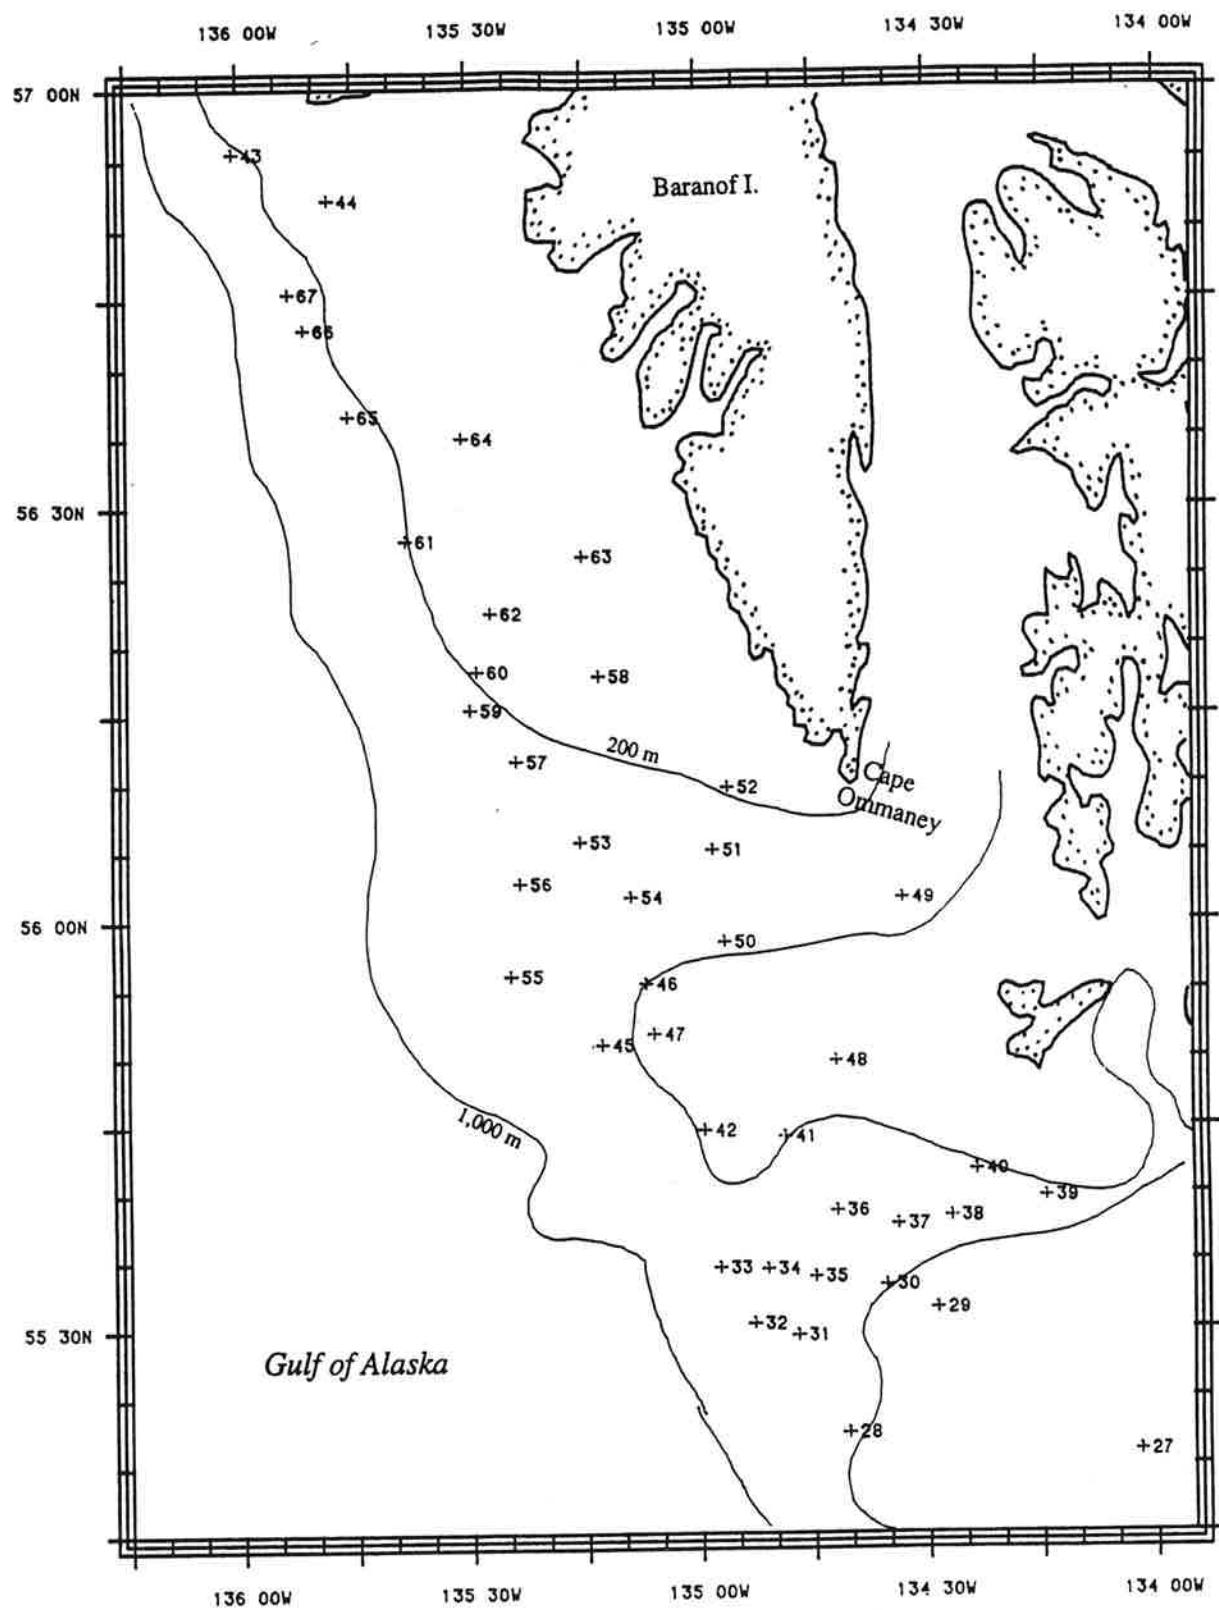

Figure B.2.—Hauls completed in the Baranof Island/Cape Ommaney vicinity during RV *Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

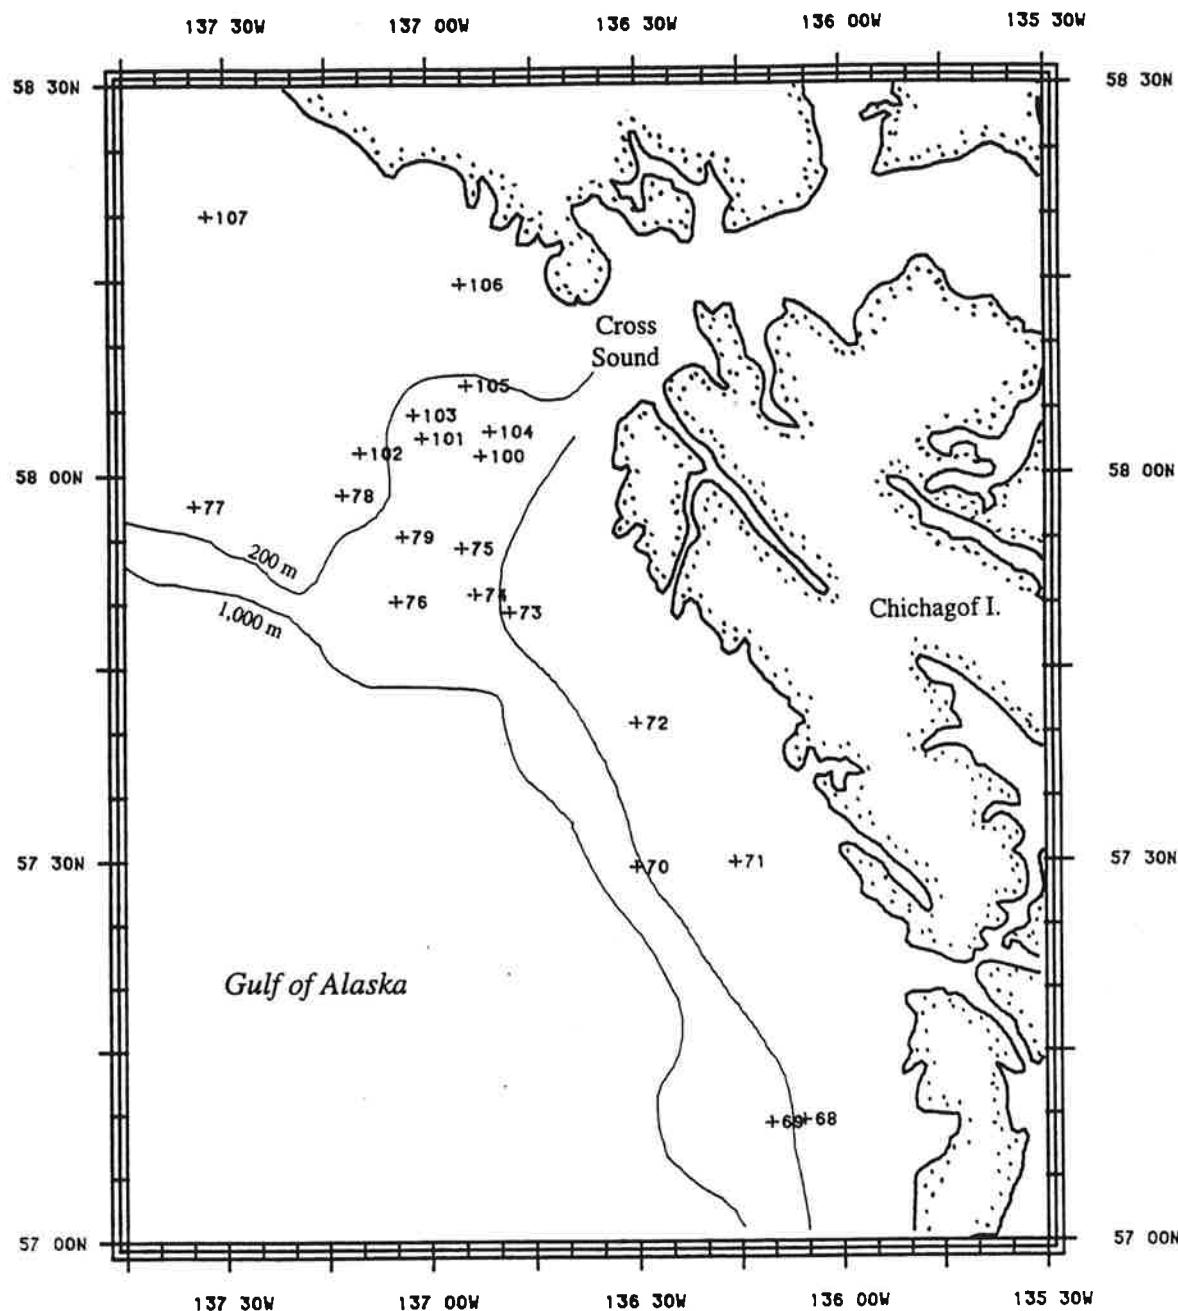

Figure B.3.—Hauls completed in the Chichagof Island/Cross Sound vicinity during *RV Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

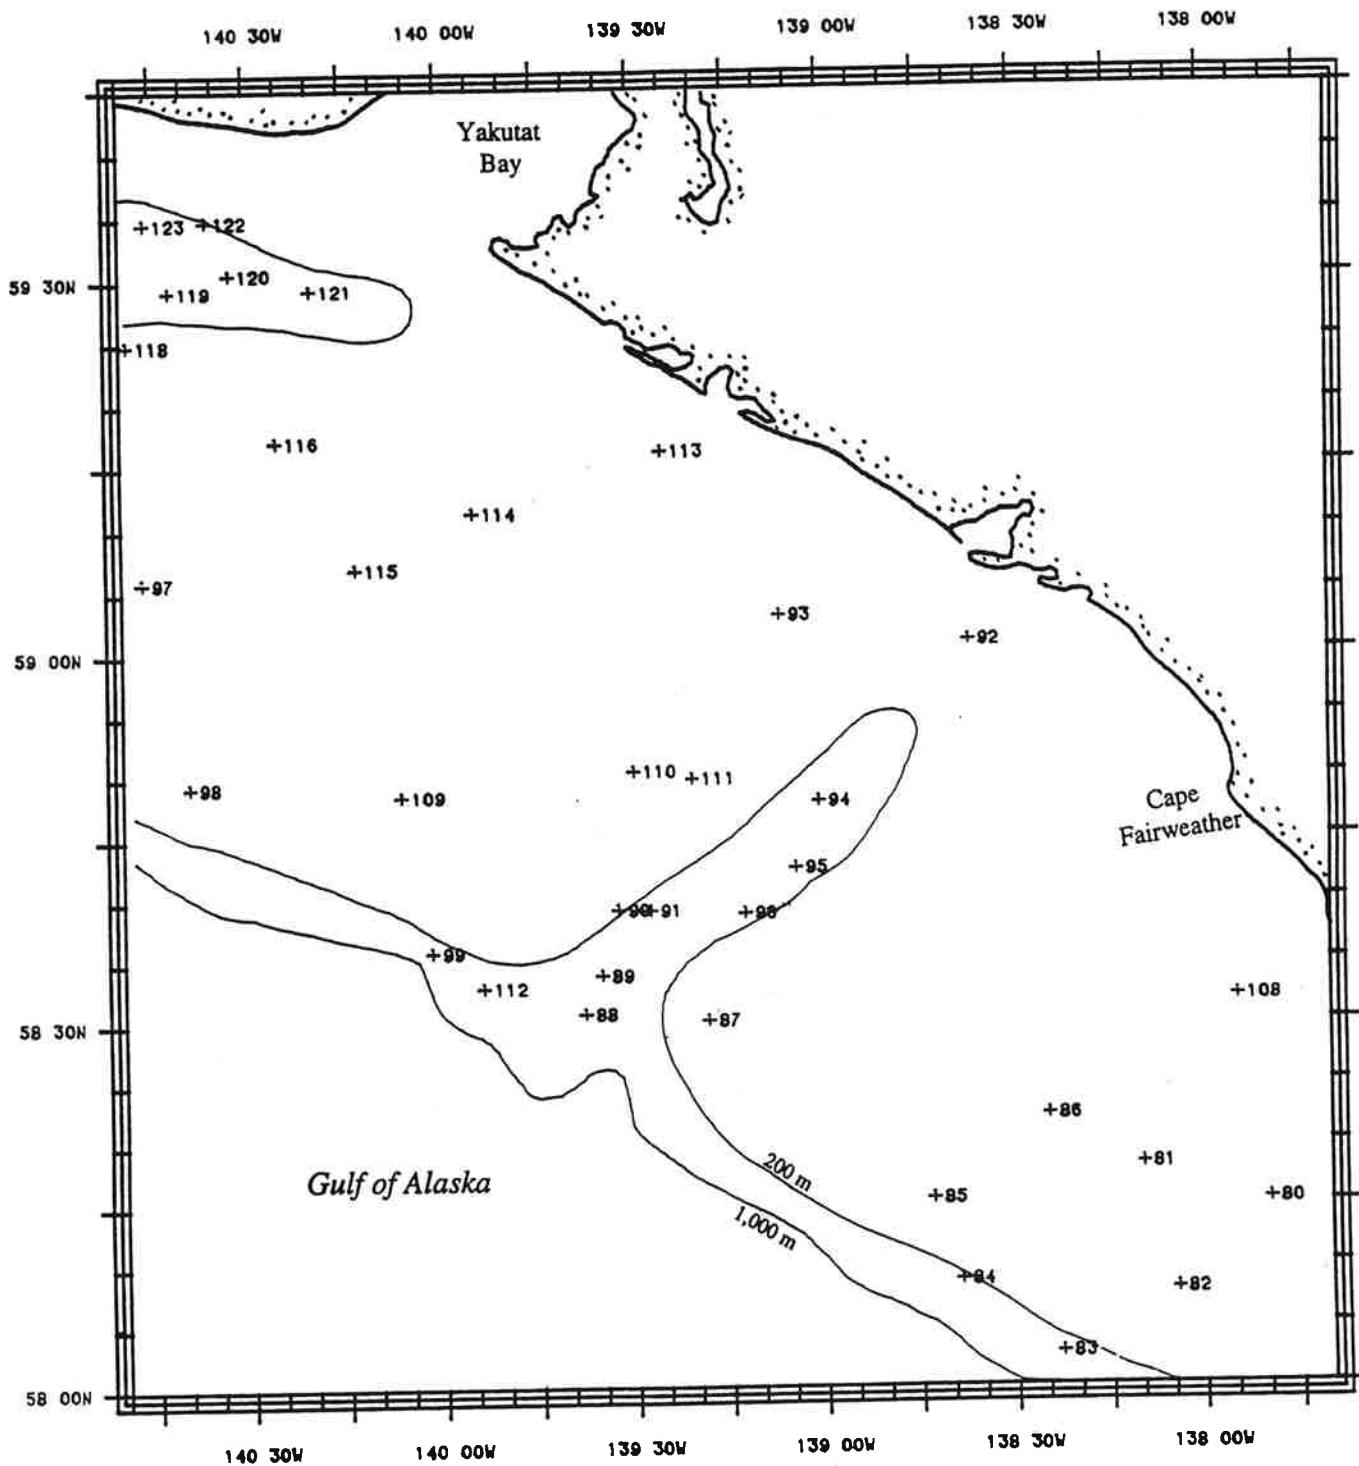

Figure B.4.—Hauls completed in the Cape Fairweather/Yakutat Bay vicinity during RV *Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

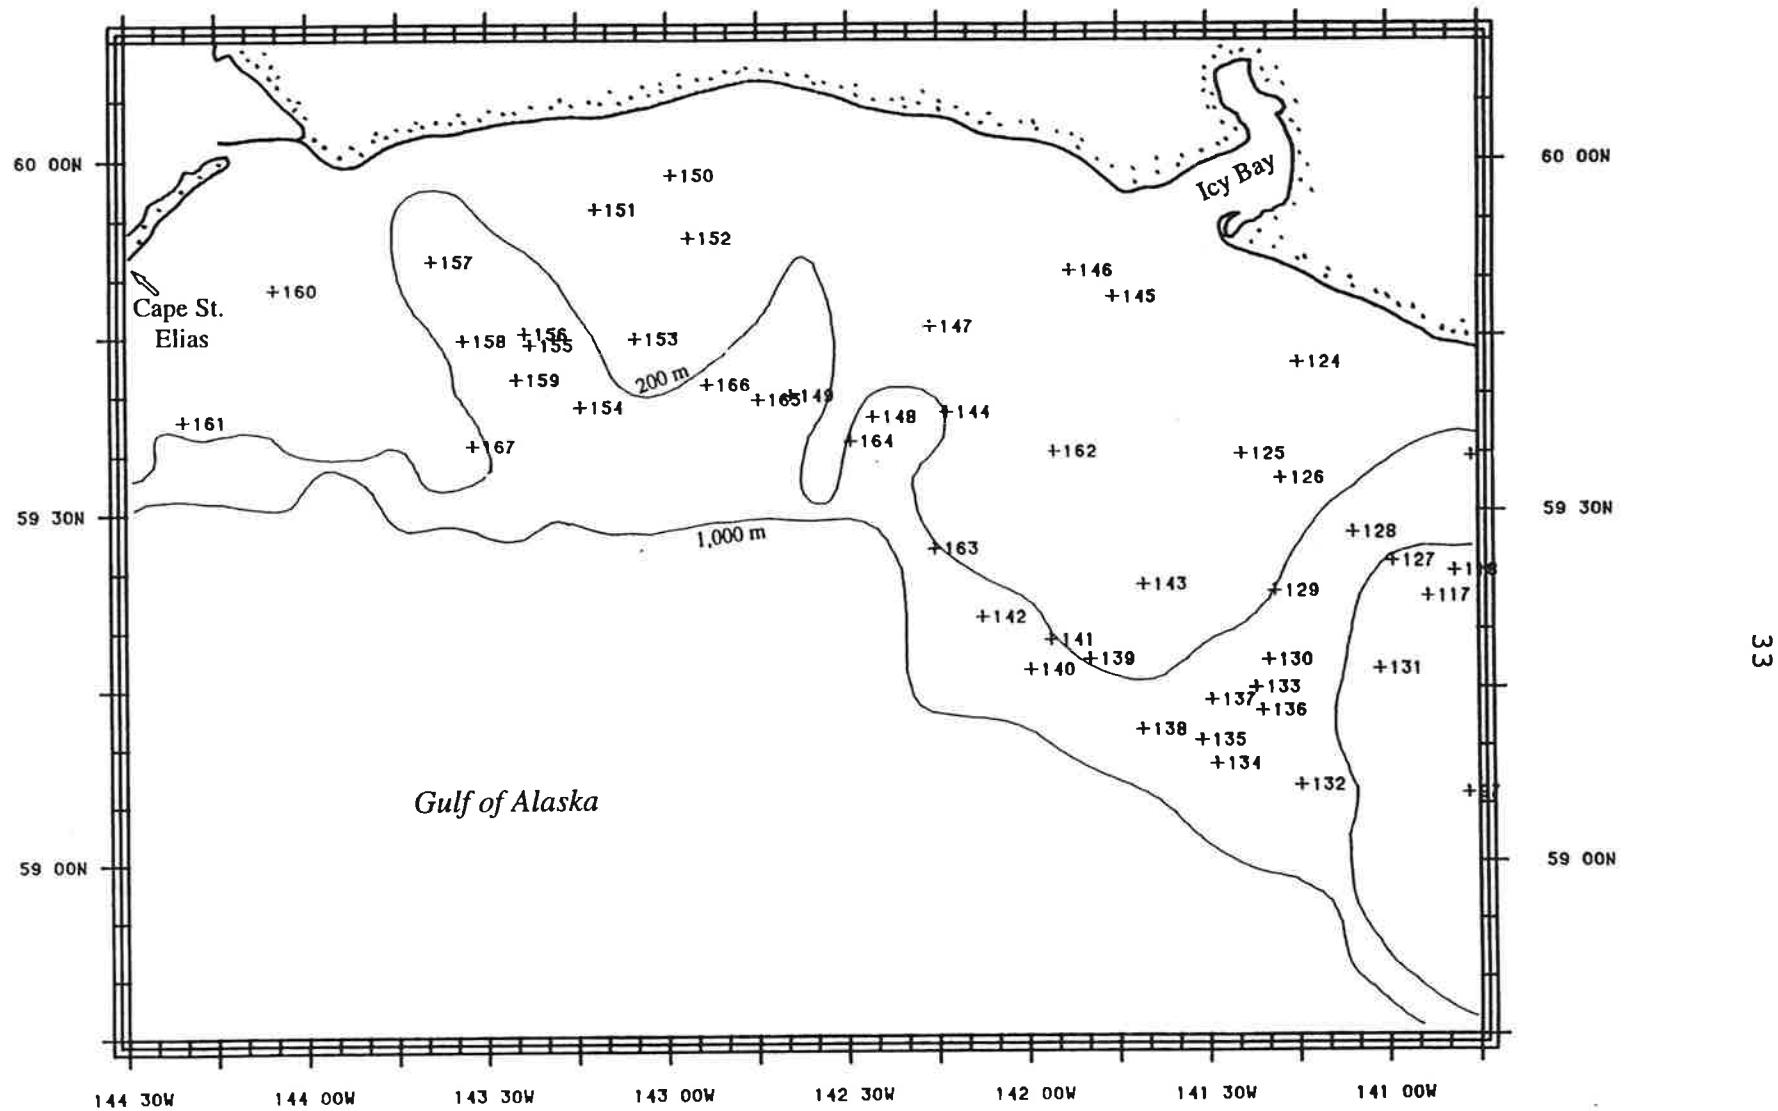

Figure B.5.—Hauls completed in the Icy Bay/Cape St. Elias vicinity during RV *Miller Freeman* Cruise 93-09, 1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

APPENDIX B

SECTION II

Position and catch data for hauls completed during RV *Miller Freeman* Cruise 93-09,
1993 triennial bottom trawl survey of the eastern Gulf of Alaska.

Table B.1.—Explanation of terms and codes used in Section II, “Position and Catch Data for Hauls Completed during RV *Miller Freeman* Cruise 93-09, 1993 Triennial Trawl Bottom Survey of the Eastern Gulf of Alaska.”

Term	Explanation
Latitude	Degrees and minutes north.
Longitude	Degrees and minutes west.
LORAN start	For haul numbers <45, rate designation is 5X (Williams Lake, BC master tower); for haul numbers >45, rate designation is 6X (Tok, AK master tower).
LORAN end	For haul numbers <45, rate designation is 5Y (Williams Lake, BC master tower); for haul numbers >45, rate designation is 6Y (Tok, AK master tower).
Gear depth	Fathoms.
Duration	On-bottom towing time in hours (0.50 h was standard duration).
Distance fished	Distance in nautical miles between start and end positions.
Performance	0 = good; no problems encountered during tow. 1 = satisfactory; net hung up or ripped during tow, but effects of damage on catch was judged to be negligible. Tow at least 10 minutes long. 5 = unsatisfactory. 6 = unsatisfactory; net hung up, and tow <10 minutes long. 7 = unsatisfactory; net ripped and some portion of the catch was probably lost.
Gear	160 = polyethylene Nor'easter net with roller gear; SCANMAR net mensuration gear not used. 166 = polyethylene Nor'easter net with roller gear; SCANMAR net mensuration gear used.
Catch	Catch per unit effort; expressed in pounds per hour of towing time on bottom.

RV MILLER FREEMAN CRUISE 93-09, 1993 TRIENNIAL BOTTOM TRAWL SURVEY OF THE EASTERN GULF OF ALASKA; CATCH IS IN LB/1.0 HR.
